| 20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Twenty-nine Light Helicopter Experimental (LHX) scout and attack mission segments were analyzed for excessive workload. Each of the mission segments was broken down into critical flight control, support, and mission functions, and positioned on a mission timeline. Functional analyses were performed by identifying the critical performance elements with their man-machine interface. Sensory, cognitive, and psychomotor workload and durations were estimated for each performance element. | | |

BLOCK 20. ABSTRACT - Continued

The analysis identified total workload for concurrent performance elements in four workload components: visual, auditory, cognitive, and psychomotor. An overload threshold was established so that overload conditions could be identified throughout the mission. Performance elements and subsystems associated with overload conditions were identified.

The analysis was conducted for three LHX configurations: (a) one crewmember, assuming existing crew station technology, (b) one crewmember, assuming a high degree of automated crew functions, and (c) two crewmembers, assuming existing crew station technology. Results included comparisons of overload conditions in the three LHX configurations.

ACKNOWLEDGMENTS

Numerous individuals aided in the conduct of these analyses and the preparation of this report. Mr. Charles A. Gainer, Chief of the U.S. Army Research Institute's Field Unit at Fort Rucker provided guidance and supervision throughout the project. Mr. Richard Armstrong, Human Engineering Laboratory's Liaison Office at the Aviation Center, Fort Rucker, provided project coordination with the Tradeoff Analysis Group within the Directorate of Combat Developments. Mr. Harry Reed, Human Engineering Laboratory, Aberdeen Proving Ground, and Mr. Robert McMullen, Army Research Institute Field Unit, assisted in the analysis by identifying key performance elements in various LHX mission profiles. Subject matter experts CW3 Richard Hopkins, a highly experienced and current aeroscout pilot, and CW3 Frank White, an equally well qualified attack aviator, reviewed the analyses and contributed valuable insight into the scout and attack mission requirements.

The authors are also grateful to Ms. Remona Locklar, Army Research Institute, and Ms. Tina Pridgen and Ms. Nadine McCollum, Anacapa Sciences, Inc., for their extensive support in the formatting and typing of this report.

SECTION ONE: INITIAL ANALYSES, SINGLE CREWMEMBER,
NO AUTOMATION

BACKGROUND

As part of its force modernization effort in aviation, the Army is evaluating the concept of a multipurpose, light-weight helicopter, the LHX. One of the major design goals for the LHX is that it should be capable of performing its various missions with a single crewmember. This design goal is desirable for two reasons. First, it will greatly increase the number of flight hours that can be flown with a given aircraft-to-pilot ratio. Second, design for single crewmember operation will result in a lightweight LHX with a smaller target profile. The small profile is particularly desirable in the scout-attack version. Design for single crewmember operation of the LHX may require considerable effort and expense to automate many system operations and mission functions. The purpose of these analyses is to provide baseline human performance data for evaluating various automation options and for assessing the feasibility of operating the LHX with a single crewmember.

The Army Research Institute (ARI) Field Unit at Fort Rucker was tasked, as the lead element, to develop analyses of LHX Scout-Attack (SCAT) missions in a message from Commander, Aviation Research and Development Command (AVRADCOM), dated 072325Z July 1983. As stated in the tasking document, the purposes of the analyses were (a) to evaluate the feasibility of single pilot LHX mission performance, and (b) to help identify the equipment, operation, and mission functions where automation would be most beneficial. The analyses were envisioned as useful in defining LHX aircrew selection and training requirements.

TECHNICAL OBJECTIVES

In accordance with the tasking message, the initial analyses were designed to achieve the following technical objectives:

- provide an objective method for evaluating the feasibility of single pilot operation of the LHX during Scout-Attack missions, and
- provide analytical material for identifying equipment operation and mission functions where automation can reduce pilot workload and enhance mission performance.

Because of severe time limitations, the methodology adopted for the initial analysis was designed to provide

approximate, first-iteration results at the function level. In developing the methodology, certain procedural limitations were necessary. These limitations are listed below.

- Subsystems, and procedures for their operation, were viewed in non-specific, generic terms.
- The level of analysis was limited to identification of general performance elements within functions.
- Analyses addressed only primary aeroscout and attack mission functions under normal operating conditions. Degradation resulting from system failures, visual obscuration, or enemy countermeasures were not addressed.
- No validation was possible except for content review by subject matter experts.
- As a baseline case, the general level of subsystem and weapon technologies for the LHX were assumed to be comparable to those provided in the OH-58D and AH-64A.
- Time estimates, cognition requirements, and other parameters of mission functions were based upon the analysts' understanding of current Army doctrine and tactics.
- The LHX mission analyses prepared in this study will become a baseline for follow-on efforts comparing alternative combinations of man/equipment capabilities.
- These analyses will be subject to change and further refinement as equipment configuration becomes known.
- A standard vocabulary of verbs and objects was established and applied in these analyses. The vocabulary is provided in Appendix A.

Within the above limitations and assumptions, the analytical methodology was organized into the four tasks described in the following paragraphs.

Identification of Mission Phases and Segments

Phases are defined as the major units by which all missions can be characterized (e.g., enroute, reconnaissance, target servicing, etc.). Segments are analytically convenient groupings of related activities which take place within

a phase (e.g., the target servicing phase may include segments such as target acquisition, handoff, and/or direct engagement). The phases and segments for these analyses were developed through examination of 24 LHX (SCAT) profiles prepared by DCD at the U.S. Army Aviation Center (USAAVNC). Based on an examination of these profiles, the matrix shown in Table 1 was developed. The matrix shows the 12 major SCAT missions envisioned for the LHX. The "X"s were placed in the columns to signify the segments judged to be prominent within each mission. The cells with an X in parentheses were selected for analyses of functions.

Identification of Functions Within Segments

Once mission segments were identified, it was possible to analyze their execution in terms of essential or critical functions. Since explication of workload and operational effectiveness variables were guiding considerations in the analysis, it was necessary to identify those functions that must occur within a segment, and also to estimate when they occur in relation to one another. Excessive operator workload (and performance degradation) may result from either (a) inordinate time pressure among sequential functions, or (b) when two or more functions, each having high workload demands, must be performed concurrently. Worksheets were developed to depict both concurrent and sequential functions. It was reasoned that concurrent or overlapping performance is most likely to be required among functions belonging to different categories, as listed below.

- Flight Control - those functions which are directly involved in flying aircraft,
- Support - functions which support both flight control and mission functions, but are not directly involved in either; examples include checking systems and threat warning displays, navigation, radio management etc.
- Mission - functions directly involved in performing mission objectives; examples include target acquisition, engagement, etc.

Accordingly, segment summary sheets were developed which provide separate columns for categorizing each function. An example of a summary sheet showing functions involved in an air-to-air engagement is presented in Table 2.

Table 1

SCAT Missions, Mission Phases, and Segments

Table 2

Segment Summary Worksheet

Phase Target Service, Air-to-AirSegment 25: Engagement Air-to-Air Method From Masked Position

| FLIGHT CONTROL | SUPPORT | MISSION |
|---------------------------------|-------------------|----------------|
| Hover Masked | Check A/C Systems | |
| Unmask Sensor | | Track Target |
| Align Heading on Target Bearing | | Estimate Range |
| Unmask Aircraft | | Prepare Weapon |
| | | Track Target |
| Deploy to Cover | | Fire Weapon |

Two rules were adhered to in preparation of segment summary sheets. First, functions were included in segments only if they were considered critical for accomplishing the specified mission activity or if they must be performed on a recurring basis, independent of mission activity (e.g., check aircraft systems). Second, to the extent possible, initiation times of functions were staggered to reflect logical sequencing and to avoid unnecessary overlapping of performance elements. In preparing these summary sheets, every reasonable effort was made to conform to accepted aeroscout and attack mission doctrine. ATMs, field manuals, and existing task analyses were used as references. Additionally, all summary sheets were revised to incorporate recommendations from aeroscout and attack subject matter experts (SMEs).

Summary sheets were initially prepared for all 31 segments in Table 1 shown with an X in parentheses. Subsequently, alternative performance methods were included for some segments, thus increasing the number to more than 40. Several segment summaries contained virtually identical performance procedures. Eliminating such duplicates reduced the number of summary sheets to 29. Summary sheets retained for further analyses are shown in Appendix B.

Analyses of Functions

The completed segment summaries were used to identify functions for further analyses. The 29 summaries contain 58 functions, including alternative methods. These 58 functions were analyzed in terms of their respective performance elements, workload, and time variables. A sample of a completed worksheet used in conducting the analyses is shown in Table 3.

Each performance element within a function was listed in a format containing a verb and an object. Listed performance elements were limited to those considered critical to successful performance of the function. For purposes of analysis, it was assumed that all listed performance elements are to be performed by a crewmember.

Each performance element was analyzed in terms of subsystem, workload demand, and duration. Subsystems associated with the performance elements were straightforward and evident. The subsystems listed are those primarily involved in each performance element and are intended to be generic. Workload is composed of three variables:

- sensory: complexity of visual or auditory stimuli requiring response,
- cognitive: level of thinking required, and
- psychomotor: the complexity of behavioral outputs required.

Workload in these analyses is not limited to overt behavior. A considerable portion of aviators' efforts, especially in combat missions, is occupied in sensory intake and processing. The variables listed above seem well suited to account for these subtle but important demands on pilots' resources.

The scales in Table 4 were used to quantify these variables for each performance element listed in the functions.

Scale values contained in Table 4 were applied to the function analyses after all performance elements had been identified and listed with verbal descriptors. The verbal description for each workload variable was matched with one of the categories contained in the coding charts. The number rank corresponding to the category was then assigned to the variable.

Inferences about workload demand requirements from the numbers presented in the function analyses should be in relation to the verbal anchors corresponding to the numbers in Table 4. To the extent that interpretations of numerical ratings are tied to the verbal anchors, there is a rational basis for judging the relative demands posed by performance elements. However, it should be remembered that these numbers, and the performance elements to which they are applied, represent only the best estimate of the analysis team. As such, they should be used as points of departure for further refinement or validation.

Another step in the function analyses was estimating time intervals for all performance elements. Performance element times cannot be precisely determined in advance of hardware/equipment design. Nevertheless, the time dimension was considered an essential component of the workload posed by each performance element. Therefore, the duration of each performance element was estimated and included in the analysis.

Each performance element was categorized as discrete or continuous. Discrete performance elements are characterized by actions having a definite, observable start and end point. Activation of switches, performance of procedural steps, and radio transmissions are examples of performance elements considered discrete. Continuous performance elements do not have observable start and end points. They cannot be reduced to procedures. Cyclic, collective, and pedal movements for controlling the helicopter, and tracking tasks associated with airborne sensors are examples of continuous performance elements.

The following helicopter task analyses were used as references:

- OH-58D MEP Description and Workload Analysis. Bell Helicopter Report No. 406-099-063 (Taylor, R. R., & Poole, R., 1983).
- Time Series Analysis for the AHIP. Applied Psychological Services, 1982.

- Time Series Analysis for the AH-64. Applied Psychological Services, 1982.
- Analysis of Control and Coordination During Helicopter Anti-Armor Operations. The Mitre Corporation Report No. MTR-82W00022 (Holt, C. R., & Kelbawi, F. S., 1982).

The analysts sought tasks in the reference material similar in content and mission context to the performance elements identified in these analyses. Task times published in the references were used in making the estimates of duration for the LHX performance elements.

Computation of the estimates for total function times are presented in the Comments column. The following decision rules were established for estimating total time.

- All performance element time estimates were rounded off to the half second.
- A transition time of .5 second was inserted before each performance element unless it is likely that an aviator would be in a performance mode not requiring transition to the next performance element.
- Time estimates for discrete performance elements were summed.
- Transition times were added to the sum.
- Time estimates for continuous functions judged to overlap other performance elements were not added to the sum. In these cases, the time estimates were adjusted to compensate for some degree of overlap.

Some functions require continuous performance elements having an indeterminate duration. Mission requirements are the determining factors prescribing their duration. Performance elements such as "monitor surroundings" and "survey approaches to AO" are examples. An arbitrary duration time was assigned to such performance elements for these initial analyses.

Readers are cautioned that the times in these analyses are only estimates and represent a consensus of the analysts involved in this work. The time estimates were judged to be reasonable by reviewers who are highly experienced and current in attack and scout missions, but they have not been validated. The analyses require refinement through several iterations as the conceptual and subsequent design and development phases of the LHX ensue. True validation for the

estimated times and other elements in the analyses must await further system definition.

The complete set of 58 Function Analysis Summaries are contained in Appendix C.

Summary of Concurrent and Sequential Workload Demands

The primary objective of these analyses has been to provide a data base for evaluating the single versus dual crewmember requirement and various automation options. As pointed out earlier, excessive demands on pilots' resources may be caused either by time pressure among sequential performance elements or by competing demands from performance elements which must be performed concurrently. Particular consideration should be given to the compounding of workload requirements which result when performance elements must be performed concurrently. Worksheets for tabulating the three major sources of demand were developed in order to identify concurrent demands placed on the operators' resources. A completed worksheet is presented in Table 5. A complete set of summary charts is found in Appendix D.

The worksheet consists of four main sections, three corresponding to the major function categories of (a) flight control, (b) support, and (c) mission, as discussed, and one section for summing workload demands across columns. Each category is further divided into a column for identifying the function and four small columns headed by the letters V (visual), A (auditory), C (cognitive), and P (psychomotor). Vertically, the chart is a cumulative timeline with 10-second increments.

Within the function column, each function is identified by a two-digit number. The identification number corresponds to the function identification numbers listed in the Table of Contents for Appendix D. For additional convenience, the listing of functions, including identification numbers, is also included in Appendix C.

The workload demand estimates in columns V, A, C, and P were derived from the function analyses contained in Appendix D. The numbers in each block represent the peak demand for the workload mode during the 10-second interval for that function. By summarizing workload demand for each 10-second interval, it is possible to develop a running account of these variables throughout each segment. Total demand placed on the operation for each modality (VACP) during each 10-second interval is estimated by summing across

corresponding entries to arrive at the totals in the right-hand columns.

As mentioned in the preceding section, the numbers representing workload demand are best interpreted in relation to the verbal anchors shown in Table 4. It is not possible, given the generality of analyses presented here, to develop any hard and fast rules for specifying the level where an operator's capacity is exceeded. However, Level 7 was judged to be the upper boundary of human workload capacity in any single mode.

Prudent use of the workload demand summaries can be helpful, but must be considered tentative indications of where a single operator's workload capacity may be exceeded. They provide a point of departure for assessing probable workload with varying mixes and degrees of subsystem automation. Tentative identification of operator overloading, and judgments about the probable effects of automation options are the most appropriate applications of the results of these analyses.

SECTION TWO: ANALYSES REVISED FOR ONE CREWMEMBER,
HIGH DEGREE OF AUTOMATION, AND
TWO CREWMEMBERS, NO AUTOMATION

The base case, nonautomated, single crewmember analyses reported in Section One assumed equipment configuration roughly equivalent to the AHIP Scout or the AH-64A. The results of the basic analyses are presented in Appendix C, Function Analysis Worksheets, and Appendix D, Summaries of Concurrent and Sequential Workload Demands. Every one of the 29 segments summarized in Appendix D contains several instances of overloading operator capacity. Thus, the results from the initial analyses strongly indicate that single pilot operations in the LHX will require considerable automation of crew functions. An iteration of the basic analyses assuming a high degree of automation was selected as the next analytical requirement.

Costs of automation may be unacceptable. An alternative means of reducing single pilot workload is to design LHX with a dual crewmember configuration. In fact, the Army plans to conduct tradeoff studies to determine whether one or two crewmembers are required. An iteration of the basic analyses assuming two crewmembers was selected as another analytical requirement.

This section reports the results obtained from two iterations of the basic analyses described above. The first iteration revised the initial analyses by incorporating a high degree of system automation for a single crewmember. The second iteration revised the initial analyses by distributing the Section One crew functions and performance elements to two crewmembers.

FIRST ITERATION: ONE CREWMEMBER, AUTOMATION

Several assumptions about LHX subsystem automation were stated prior to conducting this iteration. They are listed below.

Flight Control Automation

- Hover hold with altitude, heading, and drift override (gradual) switches.
- Interface with Fire Control Computer (FCC). Heading control can be slaved to the target sight reticle while tracking. Pitch should not be under FCC control

since the interface may cause unacceptable aircraft control problems, especially in hover flight.

- Automatic cruise modes for low level and contour flight with an interface with the navigation and preloaded mission data system.

Weapon Systems

- Automatic weapon selection, fusing, laser code selection, verification of firing conditions, and weapon release to achieve maximum hit probabilities.
- Weapons launcher variable elevation control slaved to the FCC (Lock-on After Launch, Folding Fin Aerial Rockets) or to target sight reticle (Lock-on Before Launch, or infrared heat seeking munitions).

Target Acquisition

Stepwise semi-automatic target acquisition system with pilot-selected modes as follows.

- Automatic search/detection within a pattern selected by pilot. Pattern selection based on simple indications of quadrant(s) and range of interest for search. Automatic cueing of "targets" having predetermined characteristics.
- Automatic recognition/classification of targets. When activated, a device scans target features to classify and assign priorities to each target on the basis of predetermined aspects. Classification symbols and numbers are automatically presented on the pilot's sight display.
- Automatic target position determination. Targets are identified using cueing numbers and a single switch is activated to obtain position data. Each target selected is automatically lased in rapid succession and all position data are entered into the mission computer for storage, handoff, or direct engagement.

Voice Interactive Data Processing

Simple voice commands or data inputs are converted to digital form for processing or transmission. It is assumed that voice commands or dictation of data will supplant use of

the data entry keyboard to the maximum extent possible. Voice interactive data processing will be capable of feeding any of the mission computer functions (e.g., target handoff, fire control, navigation, data storage, target acquisition, etc.) selected by the pilot.

Navigation System

An automatic navigation system complete with automatic updating. A map display, depicting aircraft position, along with course and distance to any selected waypoint(s) will be continually updated to maintain aircraft position centered on the display. Other information that can be presented at pilot discretion will include all last known threat/target locations, wind direction and velocity, fuel remaining, maximum range and endurance airspeeds, and estimated time enroute to selected waypoints at selected airspeeds.

Fault Detection and Threat Warning

- System fault and threat signals are automatically diagnosed and verified, with invalid signals being disregarded.
- Appropriate countermeasures such as fault isolation, electronic countermeasures, jamming, etc., are initiated automatically for valid fault or threat signals.
- Appropriate visual and aural signals, along with indications of procedures initiated, are presented to the pilot.
- All threat signal source locations are automatically stored and can be called up as vectors on the navigation display at the pilot's discretion.

All function analyses (Appendix C) in the initial analyses were reviewed and revised as appropriate to allow for the automation assumptions listed above. The function analyses in Appendix E resulted from the review and revision. Revised function analyses are indicated by the word (Revised) entered on the method line. New tables summarizing operator workload demands were developed and are printed in Appendix F. These workload demand tables summarize the effect of automation in reducing operator overload. Table 6 further summarizes comparisons for various flight regimes and for various subsystem areas. The diagonal line in each cell separates the instances of excessive workload demand reported

Table 6

Summary of High Workload Demand Incidents - Flight Regimes Vs LHX Subsystem Areas -
Single Pilot Base Case/Single Pilot With Automation

V = Visual; C = Cognitive; P = Psychomotor

in the basic analyses, Appendix D, from the instances of excessive workload demand reported in the first iteration of the analyses, Appendix F. The number of instances to the left and above the diagonal are for the single crewmember, no automation analyses, and the number of instances to the right and below the diagonal are for the single crewmember with extensive automation as assumed above.

The consequences of assuming automation to the extent described above are significant. Under these assumptions, the likely occurrence of excessive workload demands are reduced to brief periods in only three segments--Evade Radar Lock-on, Tactical Movement, and Team Coordination. Each of these instances of excessive workload demand occur during nap-of-the-earth (NOE) flight, when considerable attention is required for maneuvering the aircraft along an NOE course. In this flight regime, the pilot's visual and cognitive resources are excessively taxed by attending to the sensor in order to survey airspace and/or surrounding terrain. Two out of the three instances of overload result from this combination of functions. These overload situations can be avoided operationally by the tactical expediency of separating survey or overwatch functions from maneuver functions. Using teamwork, a pair of aircraft can maneuver along a course, alternating movement and overwatch functions in a bounding overwatch. This team maneuver technique will be more important in operations with LHX aircraft flown by single crewmembers than with two crewmember aircraft.

The other instance of excessive workload demand occurs when the pilot must respond to a threat warning signal (evade threat radar) during NOE maneuvering. The cognitive and visual workload components required to respond to a threat radar lock-on signal, combined with the demands required during NOE maneuvering, will be excessive for a few seconds until an evasive maneuver has been initiated. It is doubtful that overloading the operator, at least temporarily, can be avoided in this instance.

Single pilot LHX mission performance appears feasible if automation is provided to the extent described in the assumptions. However, there are several critical questions that need to be addressed.

- What system reliability can be attained in the automated systems?
- What mission performance can be expected in conditions degraded by threat countermeasures, weather, or battlefield obscuration?

- How cost-effective will the automated systems be in comparison to a dual configuration LHX with less automation?

These issues are beyond the scope of these analyses. They should be the subjects of continuing analytical and simulator work.

SECOND ITERATION: TWO CREWMEMBERS, NO AUTOMATION

As a second iteration, the baseline analyses were reviewed to reflect how workload would be reduced by distributing crew functions among two pilots. The first step was to assign flight control functions to one crewmember and support and mission functions to a second crewmember. Assumptions about system configurations underlying the original mission analyses were retained for this iteration. No automation options were included. Equipment and system configurations roughly equivalent to the current AHIP Scout or the AH-64A remained a basic assumption.

The function analyses (Appendix C) completed in the first iteration were reviewed and divided into three groups. Twelve function analyses involving flight control performance elements were assigned to one group. Forty function analyses involving support and mission functions were assigned to a second group. Thus, 52 of the function analyses were neatly divided into flight control functions and assigned to one crewmember and support and mission functions assigned to a second crewmember. The third group consisted of six function analyses judged to have performance elements likely to be performed by both crewmembers.

The 58 function analyses are shown in Appendix G. The 12 function analyses in the flight control group are annotated "Pilot" on the Method line. The 40 function analyses in the support and mission group are annotated "Copilot" on the Method line. The six function analyses judged to have performance elements likely to be performed by both crewmembers are annotated "Both" on the Method line. The performance elements in these six function analyses have been further annotated to include whether the performance element is likely to be performed by the pilot or a copilot or would routinely be performed by both.

The tables summarizing operator workload demand (Appendix D) were revised to depict the reduced workload demands as a result of distributing the crew functions are located in Appendix H. The summary table format was revised to depict the workload demand placed on each

crewmember by dividing the cells with diagonal lines. Numbers above and to the left of the diagonal line represent workload demands on the pilot and numbers to the right and below the diagonal line represent workload demands on the other crewmember. The timeline and basic organization of the summary table were retained to enable direct comparison between the one crewmember analyses and the two crewmember iteration.

Table 7 compares the results for single vs. dual crew for various flight regimes and for various subsystem areas. The diagonal line in each cell separates the instances of workload demand reported in the basic analyses, Appendix D, from the second iteration of the analyses reported in Appendix H. The number of instances to the left of the diagonal are for the single crewmember, no automation, and the number of instances to the right of the diagonal are for two crewmembers, no automation.

The most dramatic result from this iteration was the decrease in workload demand during flight control functions. One hundred and ninety-three instances of excessive workload demands were reduced to four. Reduced workload demands also occurred in the support and mission functions.

- Fifty-four instances of excessive workload demand during functions involving use of sensor displays were reduced to twenty-nine.
- One hundred and twenty-seven instances of excessive workload demand during functions involving use of sensor controls were reduced to ninety-four.
- Ten instances of excessive workload demand during functions involving use of radios were reduced to five.
- Thirty-nine instances of excessive workload demands involving comparison of the outside visual field with a map or map display were reduced to nine.
- Sixty instances of excessive workload demand involving use of a digital entry keyboard were reduced to three.

Excessive workload demands were eliminated completely from only seven of the 29 mission segments in the base-case analyses. The seven are:

- Transmit report;
- Engagement, Point Target (Remote Designation);
- Engagement, Soft Target (Cannon Fire, Hover);

Table 7

Summary of High Workload Demand Incidents - Flight Regimes Vs LHX Subsystem Areas
Single Pilot Base Case/Two Pilots (No Automation)

| | | | FLIGHT CONTROLS | ENGINE & CAUTION DISPLAYS | SENSOR DISPLAYS | SENSOR CONTROLS | RADIO | NAVIGATION DISPLAYS & CONTROLS | OUTSIDE VISUAL, MAP, & MAP DISPLAY | THREAT DISPLAY | DEK | WEAPON PANEL & CONTROLS |

| Total | V 35 193 | C 8 | P 159 | 1 1 | 1 1 | 28 23 | 8 14 | 6 15 | 5 4 | 12 3 | 39 21 | V C P |

V = Visual; C = Cognitive; P = Psychomotor

- Engagement, Soft Target (FFAR Direct);
- Receive Handoff (Voice);
- Engagement, Air-to-Air (Running Fire, Cannon);
- Engagement, Air-to-Air (Running Fire, Missile).

Excessive workload demands remain in the other 22 mission segments. The crewmember performing support and mission functions is frequently overloaded while using sensor displays and controls in the hover masked and unmasked flight regimes.

Two limitations of this second iteration need to be stated. First, the separation of crew functions between the two crewmembers was maintained throughout the iteration. This is different from the real operational world where a second crewmember sometimes can provide assistance during peak workload demand periods. This iteration does not allow for flexibility provided when two crewmembers can share functions. Second, no automation is assumed. Automation of sensor functions would significantly reduce the considerable workload demands that remain after distributing mission functions between two crewmembers. This iteration leads to the conclusion that some automation will be required if the two crewmember LHX configuration is selected.

GLOSSARY OF TERMS

APPENDIX A

TABLE OF CONTENTS

| | Page |
|--------------------------------------|--------------|
| I. VERB LIST AND DEFINITIONS..... | <i>A</i> -3 |
| II. OBJECT LIST AND DEFINITIONS..... | <i>A</i> -8 |
| III. ABBREVIATIONS AND ACRONYMS..... | <i>A</i> -21 |

I. VERB LIST AND DEFINITIONS

- ACCELERATE
 - Increase speed.
- ACKNOWLEDGE
 - Indicate that instructions have been received and understood.
- ACQUIRE
 - To gain completely; to capture.
- ACTIVATE
 - To make active; to put in active status.
- ADDRESS
 - To direct a report to the intended receiver.
- ADJUST
 - To change or correct so as to fit; conform; make suitable; make accurate.
- ALIGN
 - To bring into a straight line.
- APPROACH
 - To come closer or nearer. To fly a specified flight path bringing the aircraft nearer to a landing area, target area, rendezvous area, etc.
- ARM
 - To make ready the parts needed for operation.
- ASSESS
 - To estimate or determine the significance, importance, or value of; to evaluate.
- BRIEF
 - To supply with all the pertinent instructions or information.
- CHANGE
 - To substitute; to make different; to replace with or transfer to another of a similar kind.
- CHECK
 - Examine to determine if something is as it should be.
- CLEAR
 - To pass without contact; to visually check that path is free of obstacles; to open up or free up a display.
- CLIMB
 - Increase altitude.
- COMMUNICATE (COMM)
 - Transmit and receive information by radio or visual signals.
- COMPLETE
 - Bring to a conclusion; end; finish. To make whole, full, or perfect.
- CONTROL
 - To regulate in a prescribed manner or within safe or prescribed limits, especially in regards to movement.

| | |
|------------|--|
| COPY | - To transcribe an aural message to a written memo. |
| COORDINATE | - Adjust so as to have harmonious action. |
| CORRECT | - To make right; change from wrong to right; remove errors from. To make an adjustment so as to compensate for an error or a counteracting force. |
| DE-ARM | - To make safe. |
| DEPART | - To fly away from an area. |
| DEPLOY | - To fly a mission in accordance with a specified plan. |
| DESCEND | - Decrease altitude. |
| DESIGNATE | - To point out; mark out; indicate or specify. |
| DETECT | - To discover or find a target. |
| DETERMINE | - To reach a decision about something after thought and investigation; decide upon. To find out exactly; calculate precisely; ascertain. To decide or resolve. |
| DICTATE | - To speak aloud into a recorder. |
| DIRECT | - To manage the action of; guide; conduct, regulate. To order or command with authority. To turn or point toward an object or goal; aim; head. To tell a person the way to a place. To plan the actions and effects of. To supervise and instruct in the carrying out of a plan. |
| DISCONNECT | - To break or undo the connection of; separate; detach; unplug. |
| ENTER | - To put into; insert. |
| ESTABLISH | - To set up or make stable. |
| ESTIMATE | - To judge or determine generally but carefully; calculate approximately. |
| EVADE | - To escape from surveillance. |
| EVALUATE | - To judge or determine the quality of; to appraise. |
| FIRE | - To discharge a weapon |

- FOLLOW**
 - To direct ones course to approximate the course taken by a leading element or designated route.
- FLY**
 - To traverse a course supported only by movement through the air, out of ground effect.
- HANDOFF**
 - To transfer target information from a scout to an attack aircraft or one attack aircraft to another attack aircraft; to transfer an aircraft from one controlling agency to another.
- HOLD**
 - To maintain a steady state or condition.
- HOVER**
 - To maintain a position in the air near one place.
- IDENTIFY**
 - Given a stimulus occurrence, the act of classifying it as belonging to a set of general or specific occurrences having key elements in common.
- INCREASE**
 - To raise the amount of a variable state (i.e., size, amount, intensity, number).
- JOIN UP**
 - To come into proximity with other elements of a team, such as aircraft in formation.
- LIST**
 - To enter a series of words, names, or numbers, designating essential flight or mission information, into a catalog, directory, or roll.
- LOCK-ON**
 - To track and automatically follow a target, as by radar or other sensor.
- MAINTAIN**
 - To keep in a certain condition or position of flight.
- MANEUVER**
 - To change the movement of a flying aircraft according to a specific pattern or series of movements.
- MASK**
 - To fly to a position where the aircraft will be concealed from observation.
- MONITOR**
 - To casually attend to a source (i.e., display) of possible sensory events or changes.
- NOTE**
 - To pay close attention to.
- OBSERVE**
 - To actively and purposely attend to or witness an event or series of events for the purpose of learning, data collection, etc.

| | |
|-------------|---|
| OVERFLY | - To fly an aircraft over a specified area or position for reconnaissance or to update navigation systems. |
| PERFORM | - To do. |
| POSITION | - To place oneself or others in a location or posture. |
| PREPARE | - To set in order; to make ready. |
| PROVIDE | - To furnish or supply. |
| RECEIVE | - To acquire or get; to get knowledge or information about. |
| RECOGNIZE | - Upon being presented with a sensory event or object, to identify it by past experience or on the basis of descriptions. |
| RECORD | - To place data or stimulus events into a form for later access or recall. |
| REDUCE | - To lower or bring down |
| REGAIN | - To get back one's possession; to succeed in reaching again; to recover. |
| RELEASE | - To let go, loosen completely. |
| REPLAY | - To play again, usually for the sake of review. |
| RESPOND | - To answer, reply; to act in return. |
| REVIEW/EDIT | - To listen to a recorded report and revise for accuracy prior to transmission. |
| SEARCH | - To look over for the purpose of finding something. |
| SELECT | - To choose from among two or more options. |
| SEND | - To transmit, as by radio or other communications medium. |
| SLEW | - (Also slue.) To rotate around a pivotal point (e.g., slew the gun turret, etc.). |
| SLOW | - To reduce speed. |
| STABILIZE | - To stop all fluctuations from a desired dynamic condition, such as altitude, airspeed, heading, etc. |

- | | |
|-----------|---|
| STORE | - To put or keep for later recall and use, as in a computer memory unit. |
| STOW | - To place something in an appropriate place and condition when not in use. |
| SURVEY | - To collect information of a predetermined type on the basis of first-hand observation and measurement, or by questioning a number of authoritative sources. |
| TRACK | - To observe or plot the path or trajectory of and record data from using a sensor, such as radar; to follow as with a sight. |
| TRANSLATE | - To convert information from one form into another (usually across languages). Prefer use of "convert" in referring to changing from one metric system to another. |
| TRANSMIT | - To send out communications through electromagnetic energy. |
| UPDATE | - To provide current information on a set of changing conditions. |
| UNMASK | - To fly to a position where the sensors or aircrew can observe a target, enemy position or to where the aircraft is no longer concealed from observation. |
| VERIFY | - To confirm a tentative conclusion by using a second opinion or by using a test to resolve any doubt. |

II. OBJECT LIST AND DEFINITIONS

- A TO A
 - Air to air. The maneuvers and weapon firing (gunnery) employed when aircraft attempt to engage and destroy other aircraft in flight.
- A TO G
 - Air to ground. The maneuvers and weapon delivery operations employed when aircraft attempt to engage and destroy targets located on the ground. Definition limited to tactical operations.
- ACCESS
 - An unobstructed way or means of approaching or viewing a destination.
- ACKNOWLEDGMENT
 - A response indicating receipt and understanding of a communication.
- ADF
 - Automatic Directional Finding. A feature of low frequency radio equipment that indicates the direction to the transmitting radio source.
- AIRCRAFT (A/C)
 - Airplanes, helicopters, etc. Applies to all manned, powered vehicles designed to travel through the air.
- AIRSPACE
 - An area of space assigned for aircraft operations, with definite boundaries indicated by ground features or electronic means.
- AIRSPEED (A/S)
 - The speed of an aircraft relative to the air through which it moves.
- ALERT
 - A warning to be ready or watchful.
- ALIGNMENT
 - The arrangement of parts or components into a straight line.
- ALTITUDE
 - The height of an aircraft above the ground or above the standard.
- AMMO
 - Short for ammunition. Anything launched, dropped, fired, or exploded as a weapon.
- ANGLE
 - The difference between two planes that meet in a point, usually measured in degrees.
- AO
 - Area of operations.

| | |
|------------|---|
| APPROACHES | - Flight paths providing a means or route for reaching a destination, such as a target area or landing zone. |
| APU | - Auxiliary Power Unit. An electrical generating engine or motor (other than the aircraft's propulsion system) that is used to power essential aircraft equipment required for starting the primary engines and for other operations usually on the ground. |
| AREA | - A space on the earth's surface or in the air above the earth's surface designated for specific aircraft operations. |
| ARMAMENT | - All of the guns, weapons, and equipment serving offensive or defensive purposes on an aircraft. |
| ARTC | - Air Route Traffic Control. An agency that controls the flow and separation of aircraft traveling along specified routes. |
| ARTILLERY | - Guns of large caliber, too heavy to carry. Mounted guns (exclusive of machine guns) such as cannons and launchers. May be mobile, stationary, or mounted on ships; weapon carriers. |
| ATTACK | - Offensive acts and maneuvers associated with an assault against an enemy. |
| ATTITUDE | - The position of an aircraft in relation to a given line or plane, as the horizon. |
| AUTOTRACK | - A mode of sensor operation with the sensor automatically tracking movements of a target. |
| AVIONICS | - Electronically powered displays depicting information required by aviators in performance of aviator functions. |
| BASE | - The location from whence aircraft operations start and end. Location where the aircraft and aviators are assigned and located. The traffic pattern leg flown just before (and usually 90° from) the final approach leg. |
| BEARING | - The position or direction established by determining the number of degrees away from a known point, usually from the nose of the aircraft. |

| | |
|-------------|--|
| CHANNELS | - A band of frequencies selected to transmit or receive communications. |
| CHECKS | - The series of steps taken to examine or determine if something is as it should be. |
| CLEARANCE | - The authorization from a controlling agency to proceed in accordance with a planned flight. The distance between an aircraft and an obstacle during aircraft operations. |
| CODE(S) | - A set of signals or symbols used in sending messages, information processing, or transferring information from a sensor. |
| COLLECTIVE | - The flight control that provides the aviator with a means of adjusting the pitch angle of the main rotor blades simultaneously and also the speed of the engine. |
| CONSTRAINTS | - The restriction or confinement within prescribed limits or boundaries. |
| CONTENT | - Essential meaning or substance in a written or spoken message. |
| CONTROL | - A mechanism used to regulate and/or adjust aircraft systems or equipment. |
| COORDINATE | - Any value of a system of two or more magnitudes used to define a position or a point, usually on a map or on the earth. The value will identify the point of interest. |
| COURSE | - The movement from one point to another. A way, path, or route of movement. The direction taken, usually expressed in degrees measured from north. |
| COVER | - A hiding place or area where a helicopter will be hidden or concealed from an enemy. |
| CYCLIC | - The flight control that provides the aviator with the means of controlling the helicopter's movement about the pitch and roll axes. |
| DAMAGE | - Harm or injury to things (targets, aircraft, etc.). |
| DASH | - A sudden, swift movement of an aircraft to a destination. |

| | |
|-------------|---|
| DATA | - Things known or assumed; facts and figures from which conclusions can be inferred; information. |
| DESCENT | - A downward flight path. |
| DESIGNATOR | - A device or capability of a sensor to point out; to mark; to indicate or to specify. |
| DESTINATION | - The place toward which someone or something is going or sent. |
| DIMENSIONS | - Extent, size, shape of objects or targets. |
| DIRECTION | - The point or line along which a threat or target is moving or lies. |
| DISPENSER | - A container designed to give out or distribute its contents in predetermined portions. |
| DISPLAY(S) | - Arrangements of instruments, indicators, or electro-optical viewing surfaces on which information can be coded and presented to aviators. |
| DISTANCE | - The interval between two points, objects, lines, etc. |
| DOPPLER | - A self-contained navigation system providing worldwide navigation without ground-based aids by comparing the magnitude of change in the frequencies or wavelengths transmitted with those received. |
| DRIFT | - The deviation of an aircraft from its flight path or hover position because of wind. |
| ENGINE | - The power plant that propels the aircraft through the air. |
| EQUIPMENT | - Supplies, furnishings, apparatus onboard the aircraft or carried by a crew member. |
| EVASION | - The avoidance of a threat. |
| FAC | - Forward Air Controller. A member of the tactical air control party who, from a ground or airborne position, controls aircraft engaged in close air support of ground forces. |

| | |
|---------------|---|
| FAO | - Forward Air Observer. A member of the tactical air control party who, from a ground or airborne position, observes aircraft engaged in close air support of ground forces and reports on results of the engagement. |
| FCC | - Fire Control Computer. An automatic data processing device for calculating weapon parameters and for controlling weapon firing operations for maximum engagement effectiveness. |
| FIRE | - A discharge of firearms or artillery; shooting. |
| FIX | - The position of an aircraft determined from the bearing of two or more known points or radio signals. |
| FORMAT | - The general makeup, arrangement, or organization of a message. |
| FORMATION | - An arrangement or positioning of airplanes in flight. |
| FORMS | - Printed documents with blank spaces to be filled in to report on aircraft or mission status and results. |
| FOV | - Field of view. An area of observation as through a sensing device or from a visual position. |
| FREQUENCY | - The method of identifying (usually in Hertz or cycles per second) specific carrier waves used in radio communications and for radio navigation equipment. |
| FUEL | - Material burned by the engine to produce power for the aircraft. |
| GO-AROUND | - Maneuver flown after an abortive landing approach. |
| GROUND FORCES | - Generic term for all ground combatants, friendly or enemy. |
| GROUND SCOUT | - A soldier or other ground-based observer locating targets and providing instructions normally provided by aviators in scout aircraft. |
| G/S | - Groundspeed. Effective speed across the ground. Airspeed adjusted for the effect of wind. |

| | |
|----------------|---|
| GUN | - A weapon consisting of a metal tube from which a projectile is discharged by the force of an explosive. |
| HANDOFF | - An offensive maneuver in which target information is transferred from a scout to an attack aircraft or from one attack aircraft to another. |
| HEADING | - The direction an aircraft is moving, usually expressed as a compass reading. |
| HIT | - A blow from a weapon as it strikes its mark. |
| HLH | - Heavy Lift Helicopter. A large rotary-wing aircraft designed to pick up and transport heavy equipment. |
| HOMING SIGNAL | - A radio transmission that can be received by an aircraft or weapon and is used to guide the aircraft homeward or toward a goal and/or a weapon toward a target. |
| HOVER | - A maneuver in which the helicopter is flying suspended in the air near one place. |
| HOVER HOLD | - An automatic flight control feature, without pilot control instruments, for maintaining steady hover conditions. |
| HOVER TURN | - A repositioning of the nose of a helicopter from one direction to another while flying suspended in the air near one place. |
| IDENTIFICATION | - A mode switch on an IFF Panel. When selected, the IFF electronically transmits an identification code. |
| IFF | - Identification Friend or Foe. An electronic system for recognition of friendly aircraft. |
| ILS | - Instrument Landing System. A system of radio signals that transmits precise landing course and glide path information to be translated by aircraft instruments and interpreted by aviators, thus enabling recovery of aircraft during adverse weather conditions. |
| IMPACT | - The contact and resulting destruction when a weapon strikes a target. |

| | |
|-------------------------|---|
| INDICATORS | - Devices such as gauges, dials, registers, or printers that measure and visibly display information required by crew members. |
| INSTRUMENTS | - Devices for indicating or measuring condition, performance, position, direction of flight, and operation of aircraft subsystems. |
| ITEMS | - Particular things or units in an inventory or a list of things. |
| JOIN-UP | - A flight maneuver performed with the objective of entering and becoming a member of a formation of aircraft, or the completion of a planned rendezvous with another aircraft. |
| LANDMARK | - A prominent feature of the landscape serving to identify a particular locality or position of an aircraft or target. |
| LASER | - (Light Amplification by Stimulated Emission of Radiation). A device in which atoms, when stimulated by focused light waves amplify and concentrate the waves, then emit them in a narrow, intense beam. Used as a sensor to designate, aim, and direct a weapon or measure range. |
| LASER CUE | - A mode of operation enabling a sensor to receive target location from a laser. |
| LASER RANGEFINDER (LRF) | - A device that emits a focused beam of amplified light waves onto a distant object or target in order to measure range. |
| LIFT-OFF | - The upward movement of a helicopter as it leaves the ground. |
| LINE OF SIGHT (LOS) | - An imaginary straight line joining the center of the eye of an observer with the object viewed. |
| LOCATION | - An area marked off or designated for a specific purpose. |
| MANEUVER(S) | - Any change of movement by a flying aircraft. |
| MAP | - A printed representation of the earth's surface showing ground features, such as mountains, bodies of water, roads, cities, etc. |

| | |
|------------------------|--|
| MAXIMUM POWER | - The maximum torque the engine is capable of developing based upon the pressure altitude, temperature, and calibration factors for the aircraft. |
| MEDEVAC | - Medical evacuation. A mission flown for the purposes of evacuating casualties from a battle area. |
| MESSAGE | - A communication passed or sent between aviators by speech, electro-optical, or other signal means. |
| MISSION | - A specific combat operation assigned to an aircraft and its crew. |
| MODE(S) | - A manner or way of operation, the methods of employment. |
| MOVEMENT | - A change of location of an aircraft, troops, tanks, etc., as part of an operation or maneuver. |
| NAP OF THE EARTH (NOE) | - The airspace close to the earth amidst trees, ridges, and other terrain or man-made features providing concealment for helicopters in flight. |
| OBSERVATION | - Reconnaissance to gain information about the terrain and enemy. |
| OVERWATCH | - Surveillance of terrain on which an enemy might be positioned in order to provide warning to friendly helicopters in the flight formation; a maneuver flown by helicopters in formation where surveillance is performed by one helicopter crew while the others move concealed by masking; the surveillance functions alternate between members of the formation as the movement proceeds. |
| PATH | - A route of flight movement to a destination. |
| PATTERN | - A prescribed route or movement for the flow of aircraft traffic; a grouping or distribution such as from a number of bullets, rockets, or missiles when they are fired at a mark. |
| PEDALS | - The controls in a helicopter operated by the feet with the primary purpose of counteracting torque, thus maintaining nose alignment and aircraft heading as desired, and for coordinating force vectors during turns. |

| | |
|-----------------|--|
| PERCENTAGE | - The amount or number expressed in rate per hundred. |
| POINT | - A particularly or precisely specified location, place, or spot on a map, course, or in a target area. |
| POSITION | - The place where an aircraft, target, landing zone, or other operational thing is, especially in relation to others or to a system of navigation. |
| POWER | - The capacity of the aircraft propulsion system in terms of the rate at which it can produce energy for flight. |
| PREPOINT | - A sensor mode in which the sensor automatically slews to a preselected set of coordinates. |
| PRESSURE | - A force exerted against a control lever in order to execute flying maneuvers or stabilize flight. |
| PULL-OUT | - The act of maneuvering an aircraft from a steep descent into level or climbing flight. |
| PULL-UP | - The act of maneuvering an aircraft from a descent or level flight into a climb and higher altitude. |
| RADAR WARNING | - An alarm, auditory or visual, indicating that the aircraft is being tracked by radar. |
| RADIO | - An electronic set capable of transmitting and receiving messages carried by electromagnetic energy through space, within prescribed frequencies. |
| RANGE | - The maximum effective distance that an aircraft can operate without refueling; or that a weapon can effectively fire its projectile. |
| RATE OF DESCENT | - The amount of altitude being lost in a descent per unit of time, usually expressed in feet per minute. |
| RECEIVER | - An electronic device that converts incoming electromagnetic energy or electrical signals into audible or visual signals. |
| RECORD | - The report of events stored in a reading device. |
| RECORDER | - A device for recording mission data or messages. |

| | |
|------------|--|
| REPORT | - An account of facts or the record of some observation or event. |
| RETICLE | - A network of fine lines, wires, etc. in the focus of a sensor or sight used to aid alignment or aiming. |
| RPM | - Revolutions per minute. Applies to the speed that a rotor is turning in helicopter operations. |
| RUN | - The approach to a target made by an attacking aircraft. |
| SAS | - Stabilizer Augmentation System (SAS). A system that provides short term damping of aircraft dynamics in the pitch, roll, and yaw axes, thus enhancing the stability and handling qualities of the helicopter. |
| SCAN | - A systematic search pattern from an electronic sensor. |
| SCOUT | - An aircraft sent out to observe, reconnoiter the strength, movements, etc. of the enemy and to direct attacking aircraft against enemy targets. |
| SEARCH | - An act of scrutiny, inquiry, or examination in an attempt to find something (i.e., a target), gain knowledge, establish facts, etc. |
| SECURITY | - A radio device or mode of operation that enables communication not likely to be intercepted by an enemy listener. |
| SENSOR | - Any of various optical or electronic devices designed to detect, measure, or record physical phenomena such as radiation, heat, pressure, etc., and to respond by transmitting information, initiating changes, or operating controls. Specifically, any such device used to search, detect, identify a target or ground reference, and which may respond by guiding or controlling the aircraft or weapons. |
| SEPARATION | - The airspace or distance between two aircraft flying in formation. |
| SHIFT | - A change in the observed frequency of a wave, as a light, sound, etc. caused by an increase or decrease in the distance between the source and the observer. With doppler, the change in frequency of the electromagnetic energy. |

| | |
|---------------|---|
| SIGHT | - A device used to aid the eyes in lining up a gun, or electro-optical sensor on a target or objective. |
| SIGHTING | - The act of seeing an object or target. |
| SIGNAL | - A sign or event fixed or understood as the occasion for prearranged combined action. A sign given by gesture, flashing light, etc. to convey a command, direction, warning, etc. An object or device, as a red flag, flashing light, etc. processing such a sign. |
| STATION | - A post, position, or location where an aircraft is assigned for duty or operations. |
| STATUS | - The state or condition as of a weapon or an aircraft system. |
| SURROUNDINGS | - The things, conditions that are present in a given place or within view of an observer. |
| SURVEILLANCE | - A watch kept over a target or battle area. |
| SWITCH | - A device used to activate, open, close, or divert an electric circuit associated with an aircraft system or control. |
| SYMBOL | - A written or printed mark, letter, abbreviation, or geometric form standing for an object, quality, or process. |
| SYSTEM | - A set or arrangement of components so related or connected as to form a unity or organic whole and used to perform an aircraft function. |
| TACAIR | - Tactical aircraft. Term used to designate friendly fighter aircraft providing close air support to ground and helicopter operations against an enemy. |
| TARGET(S) | - An objective, goal, tanks, force, etc. that is the object of a military attack. |
| T.D. | - Touchdown. The act of touching down or landing an aircraft; the moment at which a landing aircraft touches the landing surface. |
| TERMINAL AREA | - The region where aircraft flights end and where servicing facilities and resources are maintained. |

| | |
|-------------|---|
| TERRAIN | - Ground or earth, especially with regard to its natural or topographical features or fitness for some use. |
| THREAT | - The source of danger and potential destruction from an enemy force, such as artillery, tank, or aircraft. |
| THROTTLE | - The control that regulates the amount of fuel being metered to the engine(s). |
| T.O. | - Takeoff. The act of leaving the ground in an aircraft. The place from which an aircraft leaves the ground, the starting point for a flight. |
| TRACERS | - Bullets or shells that indicate their own courses in the air with trails of smoke or fire, so as to facilitate adjustment of the aim. |
| TRACK | - A course or line of flight, route, way; the projection of the flight path of an airplane on the surface of the earth. |
| TRAFFIC | - The movement of a number of aircraft along prescribed routes or flight paths, usually in landing or takeoff operations, but also in operations involving multiple aircraft. |
| TRANSMITTER | - The part of a radio or other electromagnetic device that generates waves, modulates their amplitude or frequency, and sends them by means of an antenna. |
| TRIGGER | - A small lever, switch, or part which when pulled or pressed activates the firing of a weapon. |
| TURN(S) | - A change in direction of flight. An aircraft maneuver resulting in a change of course or direction of flight. |
| UPDATE | - An action taken or a function performed to revise navigation data making it more accurate or concurrent with present aircraft status or position. |

- UTM - Universal Transverse Mercator. A conventional system for indicating position on the earth's surface. The earth's surface is divided into grids which are 1000 meters square. A position is easily defined in UTM coordinates by a prefix (e.g., B5) which represents a 100,000 x 100,000 meter area followed by easting (3 digits) and northing (3 digits) coordinates which locate a spot within 10 meters.
- WAYPOINT - A preselected navigation checkpoint along a planned route of flight. Location of the checkpoints are stored in the doppler and are called up for navigation purposes during the flight.
- WEAPON - An instrument or device of any kind that can be used to fight or to attack an enemy target.

III. ABBREVIATIONS AND ACRONYMS

| | |
|---------|---------------------------------|
| A | - Auditory |
| A/C | - Aircraft |
| Ack | - Acknowledge |
| Adj | - Adjust |
| Align | - Alignment |
| AO | - Area of Operations |
| C | - Cognitive |
| Comm | - Communication |
| DEK | - Data Entry Keyboard |
| Discrim | - Discrimination |
| FCC | - Fire Control Computer |
| FFAR | - Folding Fin Aerial Rockets |
| FOV | - Field of View |
| Ident | - Identification |
| Interp | - Interpretation |
| LHX | - Light Helicopter Experimental |
| LOAL | - Lock-On After Launch |
| LOBL | - Lock-On Before Launch |
| LOS | - Line of Sight |
| LRF | - Laser Rangefinder |
| Nav | - Navigation |
| NOE | - Nap of the Earth |
| Orient | - Orientation |
| P | - Psychomotor |
| PE | - Performance Element |
| PGM | - Precision Guided Missile |
| Recog | - Recognition |
| S-R | - Stimulus-Response |
| Sec(s) | - Second(s) |
| Symb | - Symbol, Symbolic |
| Tgt | - Target |
| V, Vis | - Visual |

APPENDIX E
FUNCTION ANALYSIS WORKSHEETS
(REVISED TO REFLECT AUTOMATION OF SELECTED SUBSYSTEMS)

A P P E N D I X E
TABLE OF CONTENTS

| FUNCTION NO. | FUNCTION | Page |
|-----------------|---|------|
| 01 | Acquire Position Data, Automatic..... | E-4 |
| 02 | Acquire Position Data, Shift From Known Point..... | E-5 |
| 03 | Align Heading on Target Bearing..... | E-6 |
| 04 | Assess Damage..... | E-7 |
| 05 | Check Aircraft Systems (Holding)..... | E-8 |
| 06 | Check A/C Systems (Power Change)..... | E-9 |
| 07 | Check Course Required..... | E-10 |
| 08 | Check Sensor Operation..... | E-11 |
| 09 | Check Sights..... | E-12 |
| 10 | Coordinate Mission..... | E-13 |
| 11 | Coordinate Target Selection..... | E-14 |
| 12 | Deploy to Cover..... | E-15 |
| 13 | Designate Target..... | E-16 |
| 14 | Detect Aerial Threat, Automatic Search, Cueing..... | E-17 |
| 15 | Detect Aerial Threat, Unaided..... | E-18 |
| 16 | Detect Target (Ground), Free Search..... | E-19 |
| 17 | Detect Target, Prepoint, Auto Cueing..... | E-20 |
| 18 | Establish Position (Firing or Observation)..... | E-21 |
| 19 | Estimate Range, Automatic..... | E-22 |
| 20 | Estimate Range, Unaided Estimation..... | E-23 |
| 21 | Evaluate Position..... | E-24 |
| 22 | Fire Cannon..... | E-25 |
| 23 | Fire Weapon..... | E-26 |
| 24 | Handoff Target, Laser Cueing..... | E-27 |
| 25 | Hover Masked..... | E-28 |
| 26 | Identify Target..... | E-29 |
| 27 | Maintain LOS With Target..... | E-30 |
| 28 | Maintain Separation Between Aircraft..... | E-31 |
| 29 | Maneuver NOE..... | E-32 |
| 30 | Mask Aircraft, Lateral..... | E-33 |

| FUNCTION NO. | FUNCTION | Page |
|--------------|---|------|
| 31 | Mask Aircraft, Vertical..... | E-34 |
| 32 | Monitor Terrain, Aerial Approaches..... | E-35 |
| 33 | Monitor Threat Warning Displays..... | E-36 |
| 34 | Perform Evasive Maneuvers..... | E-37 |
| 35 | Prepare Report, Digital Message Device..... | E-38 |
| 36 | Prepare Weapon, Fire and Forget/Cannon..... | E-39 |
| 37 | Prepare Weapon, Laser Cueing..... | E-40 |
| 38 | Receive Handoff, Laser Cueing..... | E-41 |
| 39 | Receive Message, Designation Coordination, Digital..... | E-42 |
| 40 | Receive Message, Standard, Digital..... | E-43 |
| 41 | Receive Message (Standard), Radio, Voice..... | E-44 |
| 42 | Record Target Data..... | E-45 |
| 43 | Respond to Threat Warning Signal..... | E-46 |
| 44 | Stabilize Aircraft..... | E-47 |
| 45 | Survey Target Area, Automatic Search..... | E-48 |
| 46 | Survey Target Area, Manual Control, Visual Search..... | E-49 |
| 47 | Survey Waypoint..... | E-50 |
| 48 | Track Target..... | E-51 |
| 49 | Transmit Message (Brief), Voice, Brief..... | E-52 |
| 50 | Transmit Message (Standard), Voice..... | E-53 |
| 51 | Transmit Report, Digital..... | E-54 |
| 52 | Unmask Aircraft, Lateral..... | E-55 |
| 53 | Unmask Aircraft, Vertical..... | E-56 |
| 54 | Unmask Sensor..... | E-57 |
| 55 | Update Doppler, Overfly Stored Waypoint..... | E-58 |
| 56 | Update Doppler, Remote Landmark..... | E-59 |
| 57 | Estimate Adjustments, Automatic..... | E-60 |
| 58 | Engagement, Air-to-Air, Establish Attack Run..... | E-61 |

| FUNCTION ANALYSIS | | FUNCTION Coordinate Mission | | METHOD | | No. 10 | | |
|----------------------|------------------------|-----------------------------|--------------------------------|---|-------------------------|-----------------|---------------------|---|
| VERB | OBJECT | SUBSYSTEM(S) | | WORKLOAD COMPONENTS | | DURATION (SECS) | DISCRETE/CONTINUOUS | COMMENTS |
| PERFORMANCE ELEMENTS | | | | SENSORY | COGNITIVE | PSYCHOMOTOR | | |
| Select | Radio, security device | Radio, security device | Vis symbol (V-5) | Correct radio? (C-3) | Switch activation (P-1) | 10 | | Each PE Occurs in sequence. |
| Transmit | Message | Radio | Auditory message content (A-3) | Encoding (C-4) | Switch activation (P-1) | 4.5 | | Total time = 101.9-137.1 seconds. |
| Note | Acknowledgement | Radio | Auditory content (A-3) | Verify content established (C-4) | ---- | 5 | | Estimated by adding: .5 transition to PE 1 5.4-10.6 for PE 1 .5 transition to PE 2 4.5-5.5 for PE 2 .5 transition to PE 3 2-5 for PE 3 3-10 secs delay awaiting PE 4 4.5-5.5 for PE 4 |
| Coordinate | Mission number | Radio | Auditory message content (A-3) | Message received? Authenti- cation correct? Mission Proc. (C-5) | Switch activation (P-1) | 4.5 | | |

TOTAL TIME 101.9-137.1 seconds
(APPROXIMATE)

FUNCTION ANALYSIS

TOTAL TIME 76.9-114.1 seconds
(APPROXIMATE)

FUNCTION Coordinate Target Selection

No. 11

METHOD

| VERB | OBJECT | SUBSYSTEM(S) | WORKLOAD COMPONENTS | | | DURATION (SECS) DISCRETE / CONTINUOUS | COMMENTS |
|------------|-------------------------------------|----------------------|-----------------------|---|----------------------------|---|--|
| | | | SENSORY | COGNITIVE | PSYCHOMOTOR | | |
| Select | Communication channels and security | Communication system | Visual symbolic (V-5) | Adequacy of setting equipment operating (C-3) | Selector switches (P-1) | '10 | Each PE Occurs in sequence. Total time = 76.9-114.1 seconds. |
| Note | Target data | Communication system | Auditory (A-3) | Authentic message received (C-6) | ----- | 30 | Estimated by adding: .5 transition to PE 1 5.4-10.6 for PE 1 .5 transition to PE 2 15-30 for PE 2 .5 transition to PE 3 7-11 for PE 3 .5 transition to PE 4 2-5 for PE 4 .5 transition to PE 5 45-55 for PE 5 <u>76.9-114.1 seconds</u> |
| Record | Target data | DEK FCC | Visual symbolic (V-5) | Encoding (C-4) | Keyboard entries (P-7) | 10 | |
| Transmit | Message (brief) Acknowledgement | Communication system | Auditory (V-3) | Encoding recall (C-4) | Switches, (P-1) | 5 | |
| Coordinate | Attack with other attack | Communication system | Auditory (A-3) | Target assignment Firing schedule (C-5) | Transmitter switches (P-1) | 4.5 | |

FUNCTION ANALYSIS

TOTAL TIME 5.1-19.5 seconds
(APPROXIMATE)

| | | FUNCTION | | METHOD | | No. 12 (Revised) | |
|-----------------------------|--------------------|----------------------|---------------------------------|----------------------------------|------------------------|---|---|
| VERB | OBJECT | SUBSYSTEM(S) | | WORKLOAD COMPONENTS | | DURATION (SECS) DISCRETE/ CONTINUOUS | COMMENTS |
| PERFORMANCE ELEMENTS | | | SENSORY | COGNITIVE | PSYCHOMOTOR | | |
| Check | Obstacle clearance | Outside visual field | Visual inspection (V-1) | Adequate clearance (C-2) | ---- | 5 | PE 1 occurs prior to start of PE 2, 3, and 4. PE 2, 3, and 4 treated as sequential for total time estimate. |
| Establish | Dash | Flight control | Visual, relative movement (V-2) | Control adjustment needed? (C-1) | Control pressure (P-4) | 3 | Total time = 5.1-19.5 seconds. |
| Stabilize (establish hover) | Aircraft | Outside visual field | Visual, detect movement (V-2) | Control adjustment needed? (C-1) | Switch (P-1) | 2-5 | Estimated by adding .5 transition to PE 1 .5-5 for PE 1 .1-4 for PE 2 .2-5 for PE 3 .2-5 for PE 4 (No transition time assumed between PE 2, 3, and 4) |
| Reduce | Altitude | Outside visual field | Visual, relative movement (V-2) | Clear? C-6? | Control pressure (P-4) | 5 | |

FUNCTION ANALYSIS

TOTAL TIME 24.2-32 seconds
(APPROXIMATE)

FUNCTION Designate Target

No. 13

METHOD (Revised)

| PERFORMANCE ELEMENTS | | SUBSYSTEM(S) | | WORKLOAD COMPONENTS | | | DURATION (SECS) DISCRETE/ CONTINUOUS | COMMENTS |
|----------------------|------------------|------------------------------------|-------------------------|------------------------------|---------------------------------|--|--|---|
| VERB | OBJECT | SENSORY | COGNITIVE | PSYCHOMOTOR | | | | |
| Align | Sight | Aud-3 Sensor control (voice) | C-3- (C-1) | P-3 | | | .2-5 | Precedes PE 2. All PEs are sequential. Transition time of .5 seconds estimated before start of each PE. |
| Select | Narrow FOV | Sensor controls | Aud-3 | Target centered? (C-1) | P-3 | | 1.0 | |
| Arm | Laser designator | Laser controls | Vis symb (V-5) | Laser ready? (C-2) | Discrete activation (P-1) | | 2.5 | Total time = 21.2-32 seconds. |
| Activate | Laser designator | Laser controls | Vis symb (V-5) | Target lased? (C-2) | Discrete activation (P-1) | | 10 | Estimated by adding: .5 transition to PE 1 2-5 for PE 1 |
| Note | Weapon impact | Sensor display | Vis monitor (V-1) | Target hit? (C-2) | ---- | | | .5 transition to PE 2 .9 for PE 2 |
| De-Arm | Laser | Laser cont | Vis symb (V-5) | Laser safe? (C-2) | Discrete activation (P-1) | | .5 | .5 transition to PE 3 2.5 for PE 3 |
| | | | | | | | | .5 transition to PE 4 6-10 for PE 4 |
| | | | | | | | | .5 transition to PE 5 2-5 for PE 5 |
| | | | | | | | | .5 transition to PE 6 2-5 for PE 6 |
| | | | | | | | | (Assumes single switch. Aud .7-1.0 for each additional switch) |
| | | | | | | | | .5 transition to PE 7 |

FUNCTION ANALYSIS

TOTAL TIME 7-11 seconds
(APPROXIMATE)

No. 14
 FUNCTION Analysis

FUNCTION Detect Aerial Threat
 METHOD Automatic Search, Cueing

(Revised)

| PERFORMANCE ELEMENTS | | SUBSYSTEM(S) | WORKLOAD COMPONENTS | | | DURATION (SECS) DISCRETE/ CONTINUOUS | COMMENTS |
|----------------------|---------------|-------------------------|-----------------------|----------------------|------------------------|--|--|
| VERB | OBJECT | | SENSORY | COGNITIVE | PSYCHOMOTOR | | |
| Survey | Airspace | Sensor display | Visual monitor (V-1) | Cueing symbol? (C-2) | ----- | 20 | PE 1 time variable for period preceding PE 2 Total time = 7-13 secs. |
| Detect | Cueing symbol | Sensor display | Visual symbolic (V-5) | Target cue? (C-3) | ----- | 5 | Estimated by adding: .5 transition to PE 2 4-6 for PE 2 .5 transition to PE 3 2-5 for PE 3 |
| Align | Sight reticle | Sensor controls (voice) | A-3 | P-3 | Target centered? (C-1) | 2-5 | |

FUNCTION ANALYSIS

TOTAL TIME
5.8-28.5 seconds
(APPROXIMATE)

No. 15

| PERFORMANCE ELEMENTS | | FUNCTION | | FUNCTION | | METHOD | |
|----------------------------|--------------------|---|--|---|------------------------|--------------------|--|
| VERB | OBJECT | SUBSYSTEM(S) | SENSORY | COGNITIVE | PSYCHOMOTOR | DURATION (SECS) | DISCRETE/ CONTINUOUS |
| WORKLOAD COMPONENTS | | | | | | | |
| Survey | Airspace | Unaided | Visual survey (V-1) | Area clear? (C-6) | ----- | 12.5 | Survey airspace time variable for period preceding A/C detection. |
| Detect | Movement | Unaided | Visual detect (V-2) | Signal maneuver (C-2) | ----- | 2 | No transition time provided to first discrete PE (2). |
| Direct | Sensor (to target) | Sensor controls A/C direction indicated | Visual align (V-4) | Approx bearing to sighting? (C-6) | Control pressure (P-4) | 5 | Total time = 5.8-28.5 seconds. |
| Identify | Threat | Visual, unaided | Visual; Movement shape (V-2) | Orientation of A/C. Type of A/C. (C-4) | ----- | 5 | Estimated by adding: .3-3 for PE 2 .5 transition to PE 3 2-5 for PE 3 3-20 for PE 4 No transition time from PE 3 to PE 4 (PE 4 time will vary depending on method of identification) |
| Identify | Threat | Sensor display (visual) | Movement shape heat signature (V-2) | Level of threat friend/foe (C-4) | ----- | 10 | |
| Identify | Threat | Sensor display (aural) | Tone(s) continuous or intermittent (A-3) | Type of threat A/C. Level of threat (C-4) | ----- | 10 | |
